

Lake Erie Harmful Algal Bloom Bulletin

26 July, 2018, Bulletin 11

Analysis

The *Microcystis* cyanobacteria bloom continues in the western basin. Recent satellite imagery (7/25) indicates the bloom is present in Maumee Bay, extending north alongshore the Michigan coast to Brest Bay, east past Middle Sister Island, and along the Ohio coast to the mouth of the Portage River. Low Concentrations of the bloom are also present within the Bass Islands and east past Kelleys Island to 10 miles outside Sandusky Bay. Observed winds Tuesday to Wednesday (7/24-25) reduced mixing and may have lead to scum formation. Measured toxin concentrations are detectable at all samples sites, but still below the recreational threshold throughout most of the bloom extent. *Keep pets and yourself out of the water in areas where scum is forming*. The persistent cyanobacteria bloom in Sandusky Bay continues.

Forecasts

Forecast winds (6-14 kn) tomorrow through Sunday (7/27-29) will promote mixing of surface waters and eastward transport of surface *Microcystis* concentrations. -- Ludema, Davis

Figure 1. Cyanobacterial Index from NASA MODIS-Terra data collected 25 July, 2018 at 11:56 EST. Grey indicates clouds or missing data. The estimated threshold for cyanobacteria detection is 20,000 cells/mL.

Figure 2. Cyanobacterial Index from NASA MODIS-Terra data collected 25 July, 2018 at 11:56.

Wind speed and direction from Marblehead, OH. Blooms mix through the water column at wind speeds greater than 15 knots (or 7.7 m/s).
