

Lake Erie Harmful Algal Bloom Forecast

NATIONAL CENTERS FOR COASTAL OCEAN SCIENCE

Imagery Analysis & Forecast - 2023-10-04

The cyanobacteria bloom in western Lake Erie has an approximate area of 100 square miles, which is a decrease in area since Oct 02. This week is seeing a resurgence of the cyanobacteria bloom. It is present in Maumee Bay and adjacent waters and extending well offshore to the east. A secondary bloom area is present east of the islands, mostly offshore. The western basin bloom is a mix of *Microcystis* and *Dolichospermum*. Sandusky Bay has a local bloom of mixed cyanobacteria. No recent toxin data currently available. --R. Stumpf 10/03/2023

The past few days of imagery can be seen at [the HAB monitoring site](#). The Lake Erie Forecast is operated by the National Centers for Coastal Ocean Science. Contact hab@noaa.gov for technical Questions. Last Updated: 2023-10-04 11 PM EST

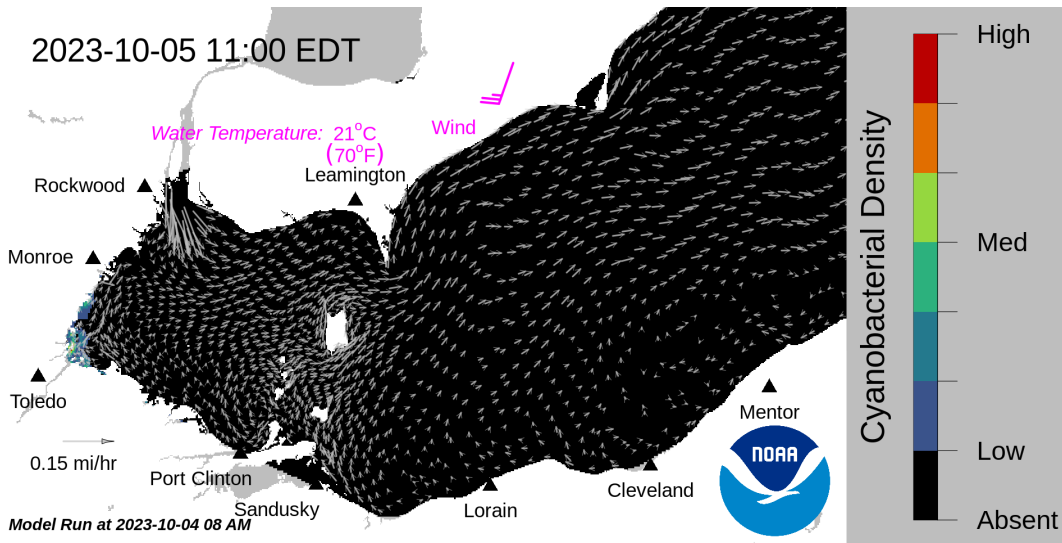

Current Lake Erie Sentinel-3 satellite imagery from the Ocean and Land Color Imager (OLCI) on Oct 03, 2023, showing bloom location and extent in the western basin. Grey indicates clouds or missing data. The estimated threshold of cyanobacteria detection is 20,000 cells/mL. Inset shows a truecolor image of the entire lake. Data derived from Copernicus Sentinel-3.

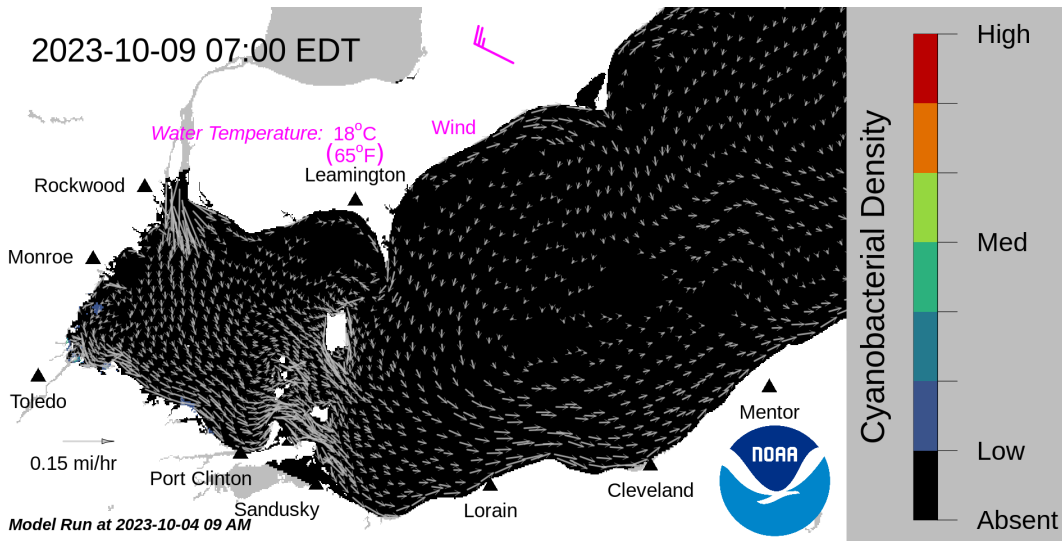

Wind speed and direction from ToledoCrib, OH. Blooms mix through water column at wind speeds > 15 knots.

Where the bloom is present in western Lake Erie, the potential risk of scum.

Forecast surface bloom position for Oct 05, modeled from the last satellite image with water currents estimated from the Lake Erie Operational Forecast System (LEOFS). Potential for bloom movement is forecast in 3-dimensions with a hydrodynamic model using satellite imagery and currents. The modeled output does not contain clouds. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.

Forecast surface bloom position for Oct 09. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.
