

Lake Erie Harmful Algal Bloom Forecast

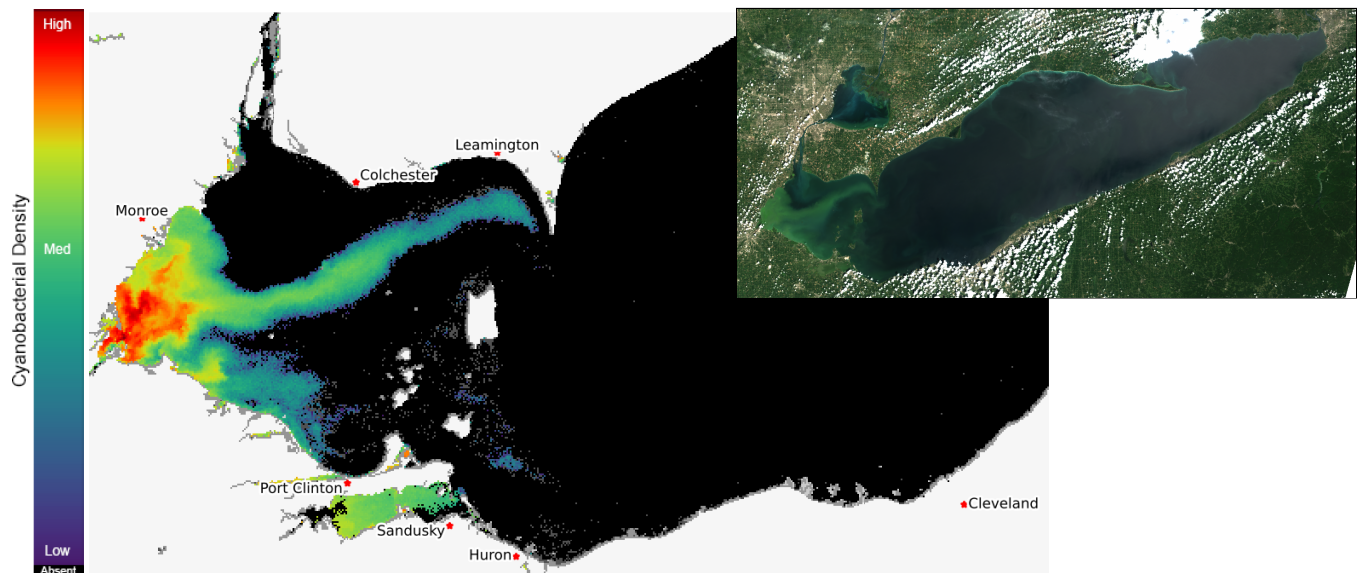

NATIONAL CENTERS FOR
COASTAL OCEAN SCIENCE

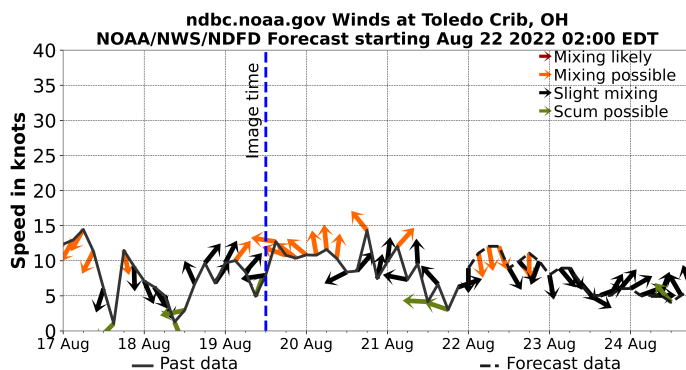

Imagery Analysis & Forecast - 2022-08-21

The *Microcystis* cyanobacteria bloom in western Lake Erie has an approximate area of 420 square miles, which is unchanged from Aug 18. The bloom extends from Maumee Bay north to Pointe Mouillee, MI and alongshore just east of Port Clinton, OH with some bloom around Kelleys Island. In the western basin the bloom extends towards Ontario offshore Kingsville. The model indicates that the bloom is expected to expand northeastward and may reach Point Pelee on the weekend. Sandusky Bay has a local bloom of cyanobacteria, which is persistent in most years. No recent toxin data currently available. --R. Stumpf 08/20

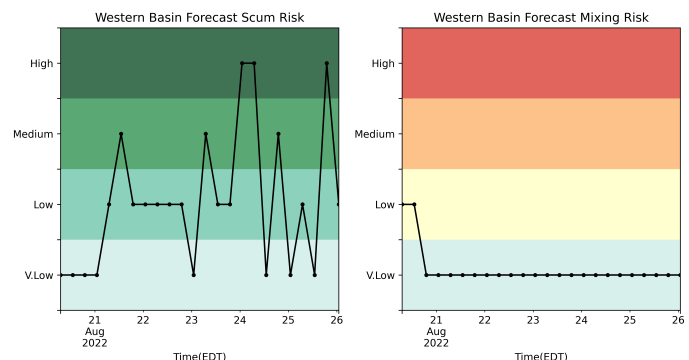

The past few days of imagery can be seen at [the HAB monitoring site](#). The Lake Erie Forecast is operated by the National Centers for Coastal Ocean Science. Contact hab@noaa.gov for technical Questions. Last Updated: 2022-08-21 11 PM EDT

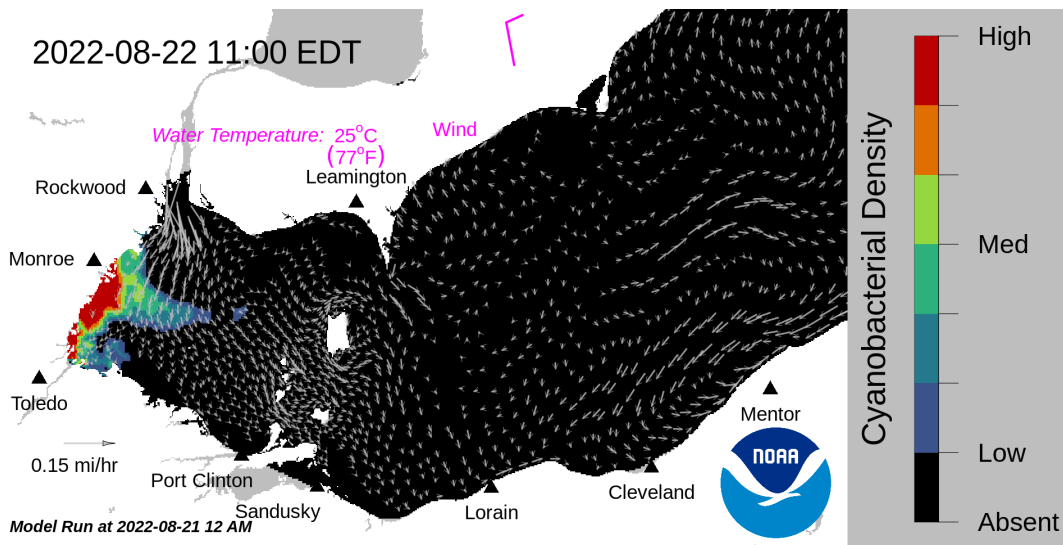

Current Lake Erie Sentinel-3 satellite imagery from the Ocean and Land Color Imager (OLCI) on Aug 19, 2022, showing bloom location and extent in the western basin. Grey indicates clouds or missing data. The estimated threshold of cyanobacteria detection is 20,000 cells/mL. Inset shows a truecolor image of the entire lake. Data derived from Copernicus Sentinel-3.

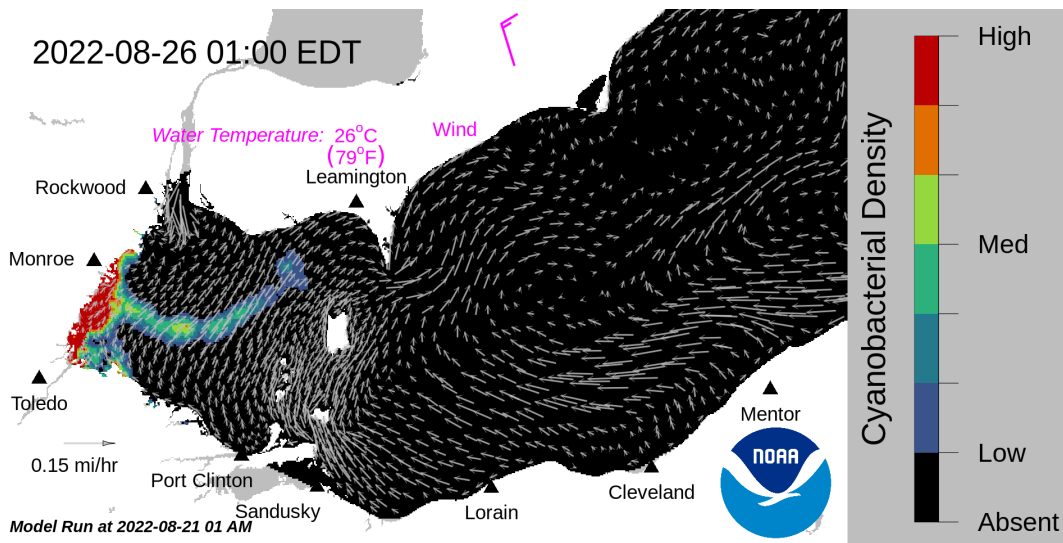

Wind speed and direction from ToledoCrib, OH. Blooms mix through water column at wind speeds > 15 knots.

Where the bloom is present in western Lake Erie, the potential risk of scum (left), and risk of mixing of the bloom down into the water column every 6 hours over the next 5 days. Mixing is weakest during mild winds.

Forecast surface bloom position for Aug 22, modeled from the last satellite image with water currents estimated from the Lake Erie Operational Forecast System (LEOFS). Potential for bloom movement is forecast in 3-dimensions with a hydrodynamic model using satellite imagery and currents. The modeled output does not contain clouds. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.

Forecast surface bloom position for Aug 26. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.
